10. Summary of my Activities and Future Plans

I am planning to finish writing several papers (see below) derived from my dissertation and to publish a book manuscript under the title: *Technology, Ideas and Great Powers Politics*.

My main research represents a manifold theory of international politics which is based upon the new concept which I refer to as "technological environment." This concept is determined by the relative technological need for territorial resources (high values for quantity and diversion, vs. low) and whether the ability to use the technology to acquire the territorial resources exists (offense and defense, on the one hand, vs. absolute weapons deterrence, on the other). These two conditions function together as a systemic selector in the ongoing competition between the systemic cultures of status-quo and territorial revisionism, respectively. My proposed theory which isolates the technological dimension in IR literature explains the international outcomes of global war and peace, the conditions under which great powers adopt revisionist behavior, and the conditions in which they tend to preserve the status-quo. This theory which is oriented in the neoclassical realist approach integrates material and ideational variables in a logical, consistent, and parsimonious manner and also clarifies and specifies their relative weight and functions. In the pre-1945 era, the industrial environment – which gave incentives and opportunities for expansion – selected the revisionist culture of place under the sun and living space instead of the ideational alternatives of pacifism and collective security, and thus, constitutes a competitive international dynamic. In the post-1945 era, the nuclear environment – which reduces expansion opportunities and incentives – selected the status-quo culture of nuclear taboo and arms control instead of the ideational alternatives of SIOPs, roll-back, disarmament, and nuclear domination, and thus, constitutes a moderate international dynamic. I propose a falsification test for a future case of nanotechnology which is characterized by strong incentives and opportunities for expansion to show that a revisionist culture of world state and global empire will be selected instead of the ideational alternatives of balance of power and preventive (nano) arms control. The theory has unique policy relevance in times of rapid technological change and can help in the development and regulation processes of nanotechnology in its national and international security context.
